

Investment Assistant

Version 0.1.1

1. About

Presented app is a web-based tool aimed to provide a stock investor with useful tools that can help in buying and selling stock shares and other financial assets.

2. Setting up

The app requires the user to have docker installed. Then, it can be set up using:
[docker-compose up](#)

This will create two containers - one for app, and the other for database, which can be accessed on the localhost:

- App - ***<http://localhost:8008/>***
- Database - ***<http://localhost:9009/>***

3. Usage

At this moment, the app user can do the following:

- **Select a stock from the list of supported assets.**
- **Press update button to fetch values from an external API:**
 - **Recent share (closing) prices for the selected asset**
 - **Recent news**
- **(After getting the prices) Navigating through the prices view:**
 - **Sort by an attribute**
 - **Change the current page either by arrows or by typing in the page number**
 - **Select dates range**

Most important things that are planned to be added in the future:

- Better GUI
- Handling multiple assets
- Visualisation of price courses etc.
- AI assistant that will give investing advices
